**POST-OP INSTRUCTIONS FOR ROOT CANAL THERAPY**

The Root Canal Therapy is now complete, however, some precautions still need to be taken to protect the tooth until the final restoration has been placed. A root canal tooth dries out and can easily break, therefore we ask you not to chew on this side until all procedures recommended for this tooth have been completed. This could be either a final filling or in most cases a post and core and a crown. If you temporary breaks or comes out, please contact the office as soon as possible. (This is extremely important, as the success of the Root Canal depends on how sterile and protected the canal is kept.) Tenderness is to be expected for the first week or so and should get better with each passing day. If the discomfort increases or swelling appears, please contact the office. Please follow the instructions on all prescriptions given by the doctor.
